# OSHW1-实验报告-20301174-万兴全

### 1.实验要求&实验内容

Write a multithreaded Java, Pthreads, or Win32 program that outputs prime numbers.

This program should work as follows: the user will run the program and will enter a number on the command line. The program will then create a separate thread that outputs all the prime numbers less than or equal to the number entered by the user.

Submit: report (in word or pdf) and source code of your program.

编写输出素数的多线程 Java、Pthreads 或 Win32 程序。

该程序应按如下方式工作: 用户将运行该程序并在命令行上输入一个数字。 然后程序将创建一个单独的线程, 输出所有小于或等于用户输入的数字的素数。

### 2.交付物

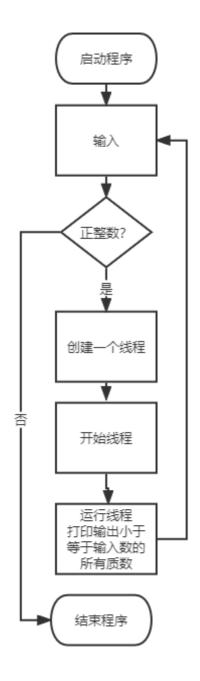

报告 (pdf 格式) 和程序的源代码。

### 3.采用技术

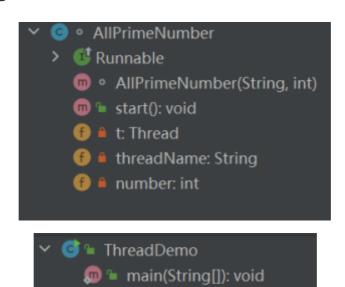

Java, c++ Pthread

## 4.程序介绍

#### 4.1程序流程

#### 4.2程序结构

### 5.关键代码

#### 5.1求素数

#### Java

```
System.out.println(number+"以内的素数有: ");
try {
    for (int i = 2; i <= number; i++) {
        boolean isPrime = true;
        for (int j = 2; j < i; j++) {
            if (i % j == 0) {
                isPrime = false;
                break;
            }
        }
        if (isPrime) {
                System.out.print(i + " ");
        }
    }
    Thread.sleep(0);</pre>
```

#### c++Pthread

```
std::cout << std::endl;
}</pre>
```

#### 5.2建立新的线程

#### Java

```
if (a > 0) {
    AllPrimeNumber primeNumber = new AllPrimeNumber("Thread " +
i, a);
    primeNumber.start();
} else {
    System.out.println("非法输入,程序终止");
    return;
```

#### c++ Pthread

```
if (a > 0) {
    pthread_create(&pid, nullptr, reinterpret_cast<void *(*)(void
*)>(getPrime), reinterpret_cast<void *>(a));
    std::cout << "线程-" << pid << "已建立\n" << a << "以内的素数有:
" << std::endl;
} else {
    printf("非法输入,程序终止");
    return 0;
}</pre>
```

### 6.程序运行截图
